

Laparoscopy

A laparoscopy, also known as keyhole surgery, is a procedure commonly used to determine a wide range of conditions inside the abdomen or pelvis and can also be used to carry out procedures such as removing a damaged organ or obtaining a tissue sample for further testing. A laparoscopy is also a common procedure used to diagnose and treat conditions in gynaecology, such as endometriosis and ovarian cysts.

Supportive consultations for the treatment you need

Our aim is to provide you with a prompt diagnosis so that we can help you on your way to effective treatment as soon as possible.

The first step is to book a consultation with one of our Consultants to determine the best course of treatment for your needs. We'll be with you every step of the way to ensure you feel secure and supported.

Prices & payment

We offer a guide price of:

Laparoscopy (diagnostic only)
£2,280

Laparoscopy including therapeutic procedures
£3,320 - £3,600

The guide price is based on the usual clinical needs of patients. For more information, please see our [terms and conditions](#).

FAQs

What does a laparoscopy involve?

A laparoscopy is carried out under general anaesthetic, so you will not feel any pain during the procedure. Your Consultant will make one or more small incisions in the abdomen and then insert the laparoscope (camera) to examine the abdomen, without having to make any large cuts.

Following the procedure, you will be taken back to your room. You can often go home on the same day you have laparoscopy, although you may need to stay with us overnight.

What if my results show a problem?

Your Consultant may take biopsies for further testing during the laparoscopy, in which case they will contact you to discuss the results. If you require any further treatment, we will be here to help you arrange any additional consultations and ensure you are fully aware of what will happen next.
